the use of natural catalysts enzymes for the transformation of non natural man made organic compounds is not at all new they have been used for more than one hundred years employed either as whole cells cell organelles or isolated enzymes 1 certainly the object of most of the early research was totally different from that of the present day thus the elucidation of biochemical pathways and enzyme mechanisms was the main reason for research some decades ago it was mainly during the 1980s that the enormous potential of applying natural catalysts to transform non natural organic compounds was recognized what started as a trend in the late 1970s could almost be called a fashion in synthetic organic chemistry in the 1990s although the early euphoria during the gold rush in this field seems to have eased somewhat there is still no limit to be seen for the future development of such methods as a result of this extensive recent research there have been all estimated 8000 papers published on the subject 2 14 to collate these data as a kind of super review would clearly be an impossible task and furthermore such a hypothetical book would be unpalatable for the non expert
